

# Career framework for IT professionals

The Institute's professional certifications span the breadth of IT with certificates at different levels enabling IT professionals to develop their knowledge, skills and competence.

The career framework provides a view of how our certifications support your career development as you progress through the SFI**Aplus** levels, in alignment with our membership grades.

Career development can often mean moving round different departments in an organisation, or to a new organisation, to develop in a role that provides interest, variety and personal growth.

Detailed career paths are available for each subject area. These indicate transitions you can make between different areas in IT, depending on your skills and experience.

\*The Skills Framework for the Information Age (SFIA) is the UK Government backed competency framework that describes IT roles and the skills needed for them. SFI**Aplus** contains the SFIA framework of IT skills plus detailed training and development resources. The result is the most established and widely adopted IT skills, training and development model that reflects current industry needs.

ITIL® is a registered trade mark of the Cabinet Office.

### Individual career paths

Our individual career paths illustrate how you can progress your career in a particular subject area and how our certifications and associated services can support you in achieving your career goals.

### Your development

Together with the support from your organisation, our career paths will support you when planning your professional development and the direction of your career.
